

Discussion Question

- 1) One common mistake when learning Git is to commit large files that should not be managed by Git or adding sensitive information.
 - that removing sensitive data from other user you cannot do. So if someone comes after your information GitHub does have factors in place.
 - don't place sensitive information, always update
- 2) Clone some repository from GitHub, and modify one of its existing files. What happens when you do `git stash`? What do you see when running `git log --all --oneline`? Run `git stash pop` to undo what you did with `git stash`. In what scenario might this be useful?
 - YOUTUBE University
 - within a the 15 min video explanation, git stash stores save changes and removes from stash. Git log all oneline shows the
 - I think I messed up... I'm going to do a little more research.
 - update I am mixing up the commons. Git stash is the file itself, got stash pop is removing and adding files, and git log all oneline is the view of the file. These are useful when it comes to editing files without messing up the original file.
